HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

EFFICIENT SUPPORT OF THE UPCOMING MASSIVE NUMBER OF IOT DEVICES

Yassine Hadjadj-Aoul

Associate professor, Univ Rennes
IRISA/INRIA Dionysos team-project

PLAN

Introduction

Access overview of IoT devices

A model for the access

Efficient support of a massive number of IoT devices

Conclusions

INTRODUCTION

Massive access of IoT
devices

THE IOT IS GOING TO BE BIG

THOUGH NOBODY REALLY KNOWS HOW BIG ...

28.1 BILLION

Units by 2020

\$1.7 TRILLION

GLOBAL SOLUTION REVENUES BY 2020

Source: May 2015

25 BILLION

Units by 2021

\$200 BILLION

SERVICES REVENUES IN 2020

\$1.7 TRILLION

GLOBAL ECONOMIC VALUE IN 2020

Source: November 2018

25 BILLION

M2M connections by 2022

OF WHICH

2.6 BILLION

ARE CELLULAR

\$1.2 TRILLION

GLOBAL OPPORTUNITY BY 2022

Source: January 2013

HOW TO HANDLE SUCH A LARGE NUMBER OF DEVICES?

A large share of IoT devices will be served by short-range radio technologies

- Unlicensed spectrum (e.g. Wi-Fi and Bluetooth)
 - Costless but ...
 - Limited QoS and security requirements

A significant proportion will be enabled by wide area networks (WANs)

- Unlicensed Low Power Wide Area (LPWA): LoRa, Sigfox, ...
 - Very limited demands on throughput, reliability and QoS
- Licensed spectrum: 4G, NB-IoT, 5G, ...
 - Largely responsible for wireless connectivity on a global scale
 - Adapted to deliver reliable, secure and diverse IoT services

CELLULAR NETWORK ARCHITECTURE

CONGESTION LOCALIZATION

A huge number of devices ...

... but a limited number of resources (i.e., # of opportunities to connect)

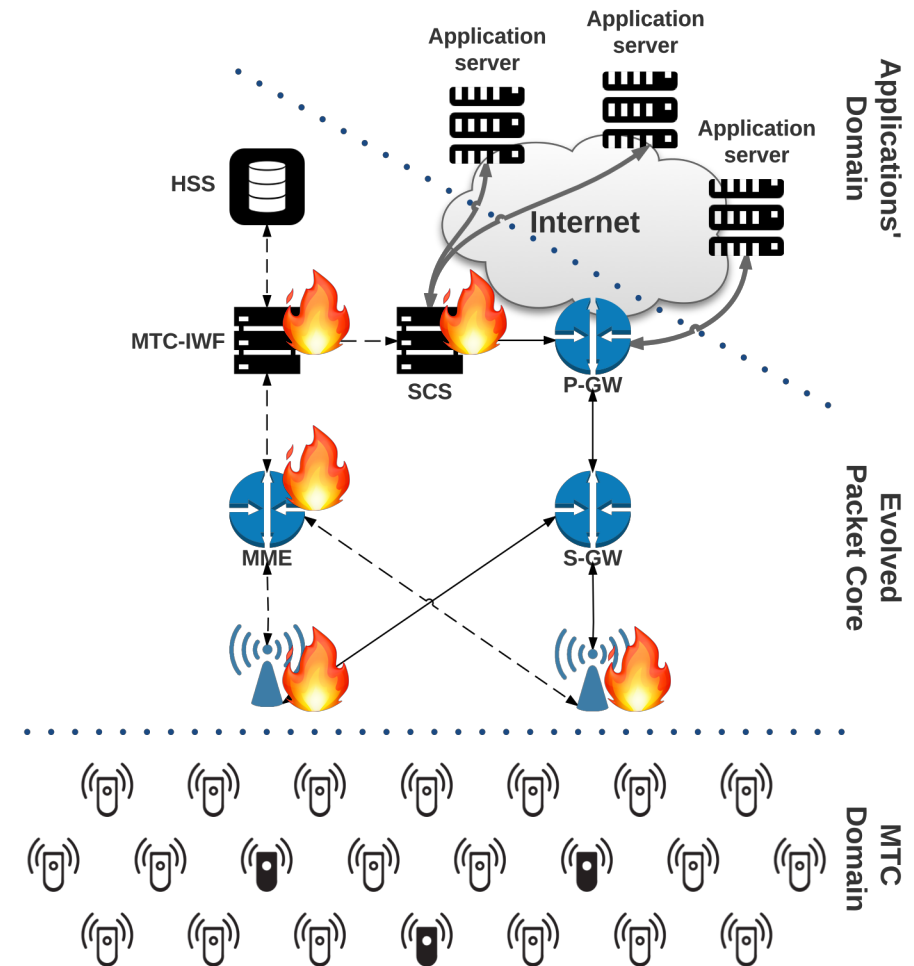

Random access

- Only way to access the network (simplest)
- **The most critical area**

Complex traffic pattern

- Poisson (e.g. credit machine in shops), Uniform (e.g. traffic lights), Beta (e.g. event driven)

Different classes of IoT (including prioritized M2M)

RISK OF CONGESTION COLLAPSE AT THE RAN

Even when having 54 opportunities, the risk of congestion is still high ...

« RAN overload control
... is identified as the first
priority improvement
area » ... 3GPP TR
37.868

ACCESS OVERVIEW OF IOT DEVICES

Understanding the
origin of the problem

ATTACH PROCEDURE

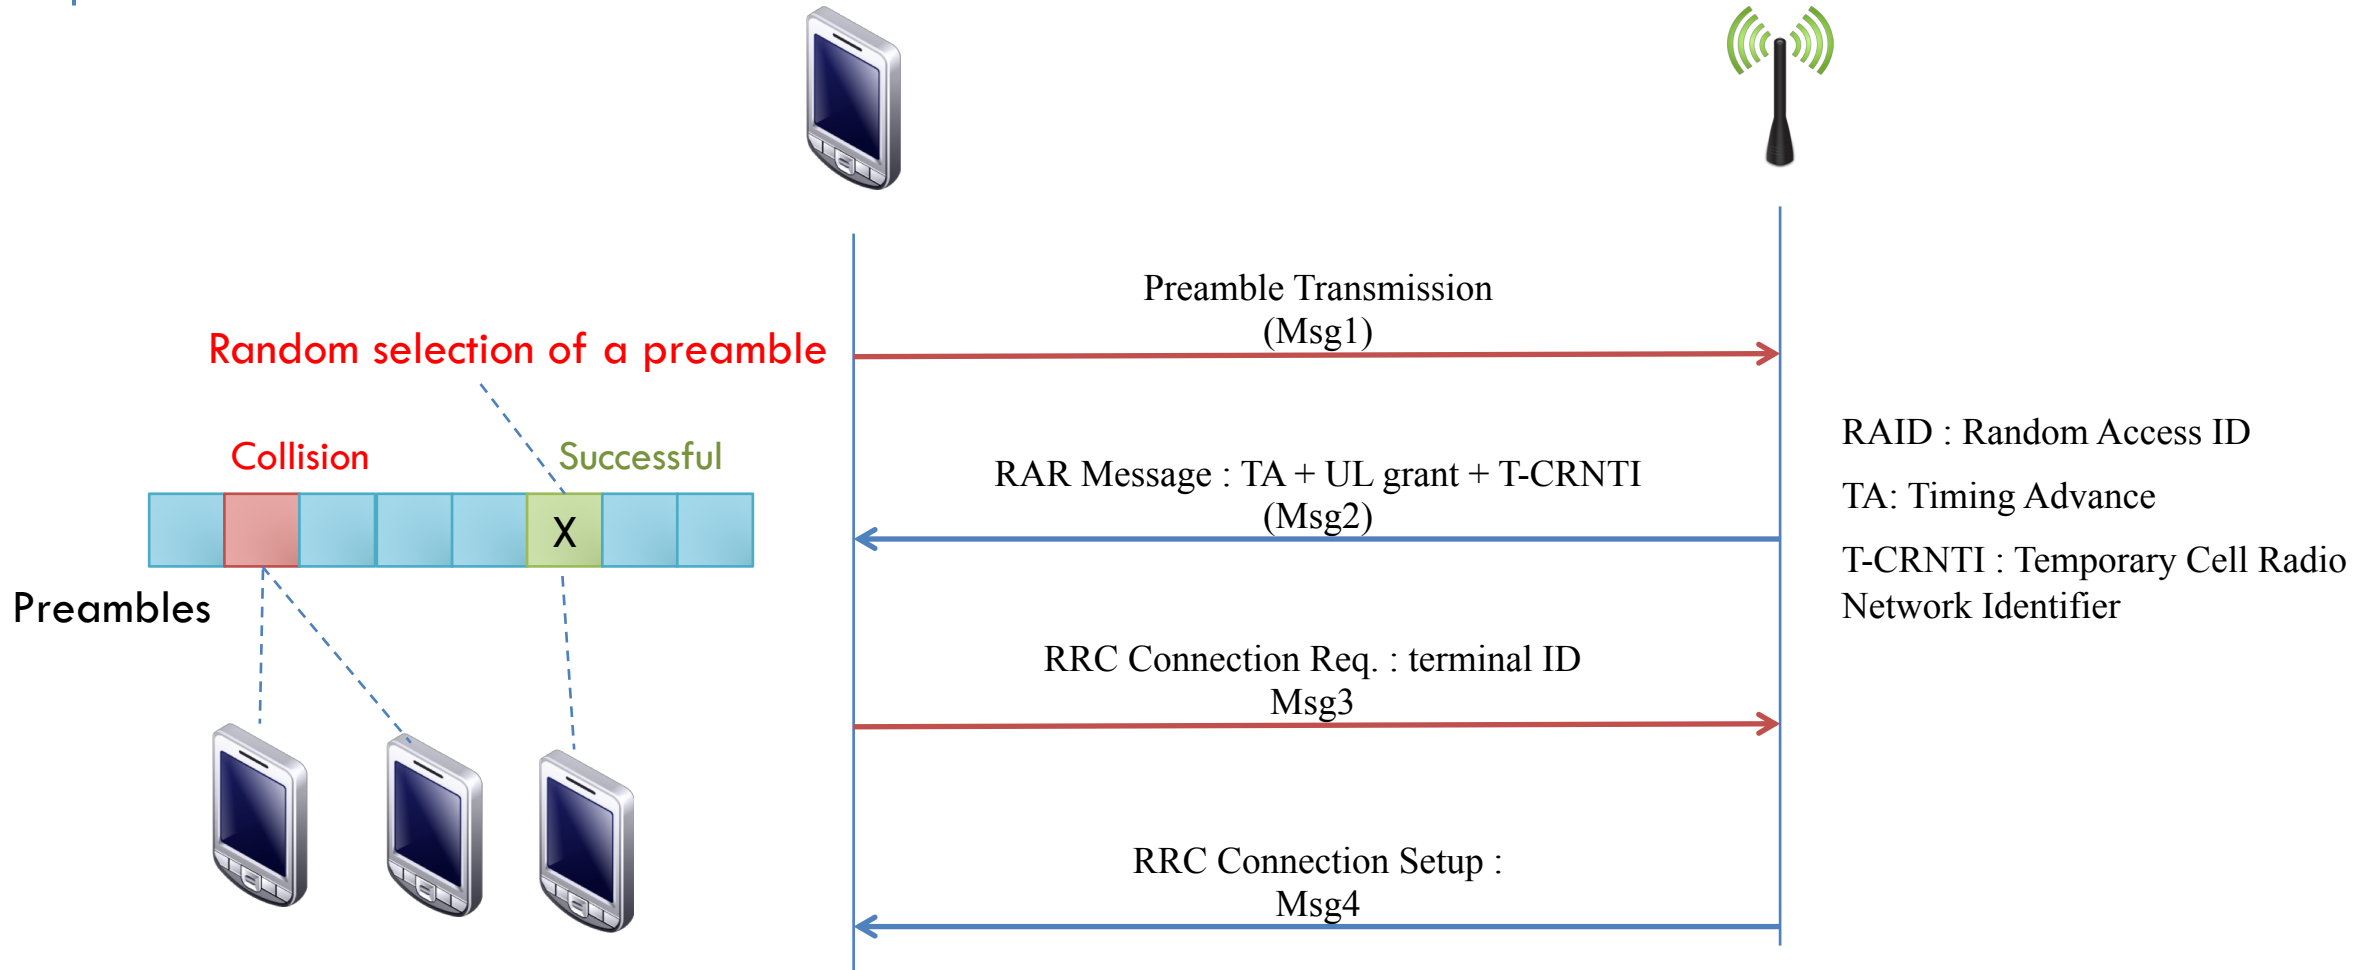

Attach procedure is needed before any connection

The main steps to move from idle to connected

- Cell search and Synchronization procedures
- Acquiring the cell system information
 - when and where the preamble can be transmitted
 - number of available RA preambles
 - maximum number of transmissions of the preamble when a failure takes place
 - size of Random Access Response (RAR) window (in number of subframes)
- RACH Procedure (**R**andom Access Channel)
 - Contention-based Random access

RANDOM ACCESS

A MODEL FOR THE ACCESS

Fluid model
approximating the
access process

MODEL FOR ACCESS (1)

Could be modeled using the classical « Balls into Bins » problem

M Balls \sim M IoT devices

Bin selection: random, uniform and independant

N Bins \sim N opportunities to connect

MODEL FOR ACCESS (2)

Could be modelled using the classical « Balls into Bins » problem

- N_I : # of idle preambles (# of bins with no ball)

$$N_I(M) = N \left(1 - \frac{1}{N}\right)^M$$

- N_S : # of successful access (# of bins with 1 ball)

$$N_S(M) = M \left(1 - \frac{1}{N}\right)^{M-1}$$

SOME EXISTING APPROACHES TO TACKLE THE CONGESTION AT THE ACCESS

Access planning

- Limit the burden ... but insufficient since some devices react to events which cannot be timed.

Grouping devices

Pull based scheme

- A paging message may also include a back-off time for the MTC

Separate RACH resources for MTC

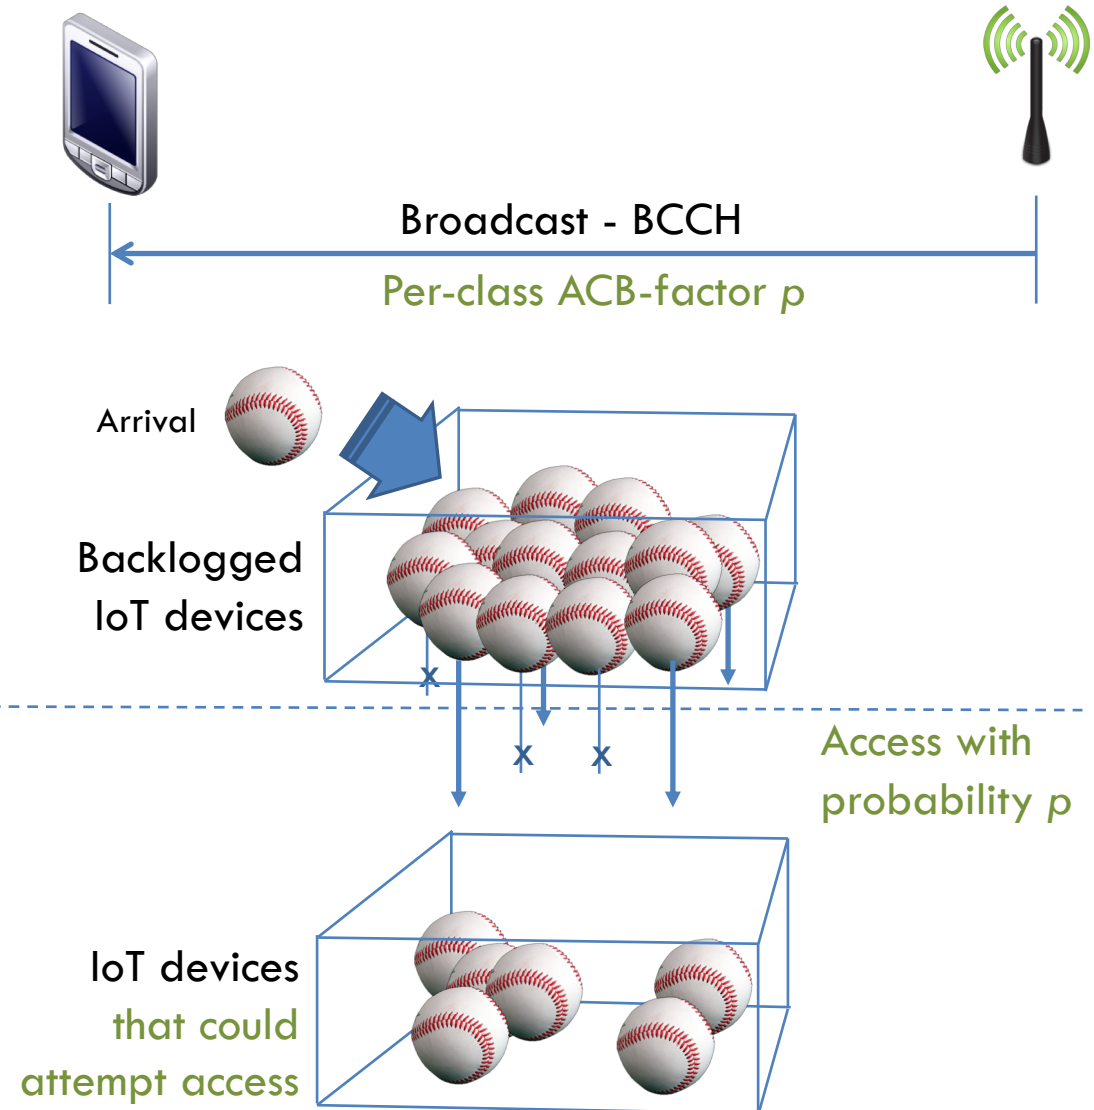

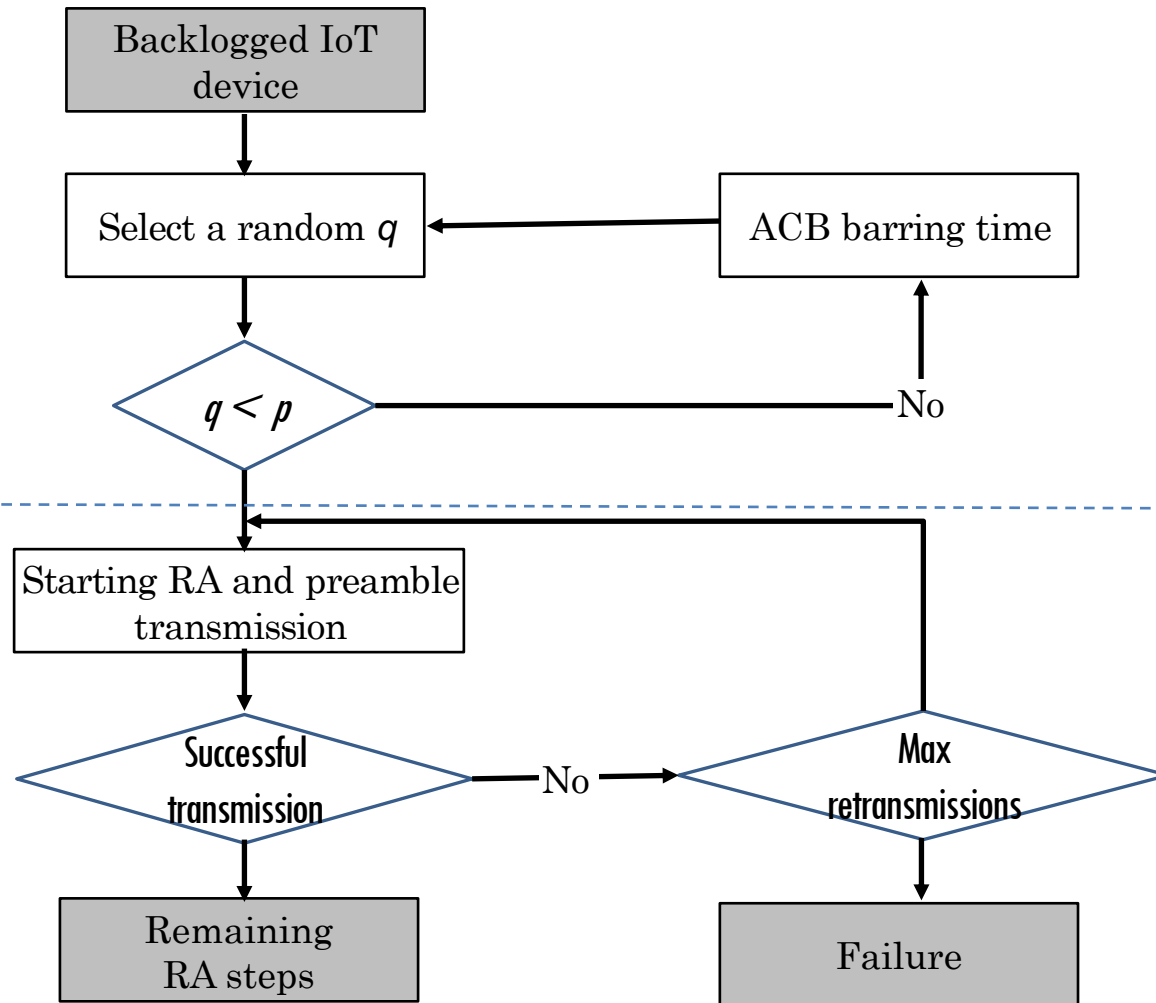

- Splitting the preambles into H2H group(s) and MTC group(s)
- or allocating PRACH occasions in time or frequency to either H2H or MTC devices.

Dynamic allocation of RACH resources

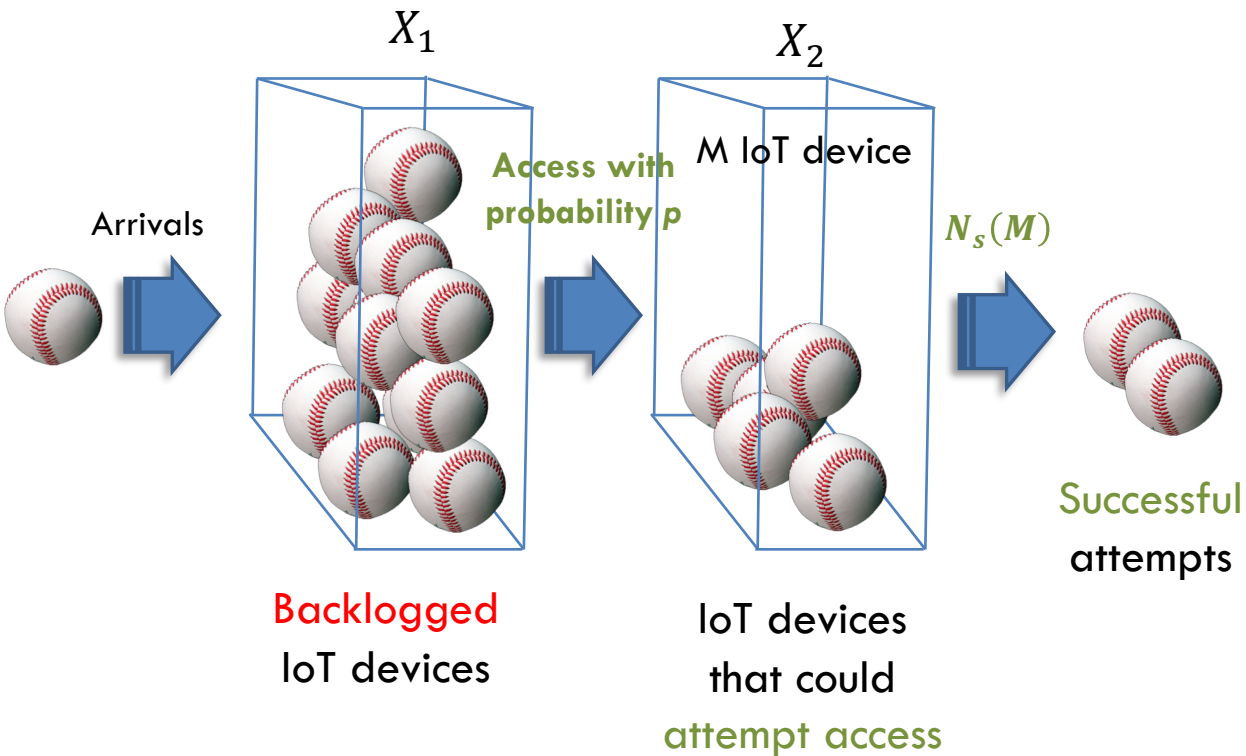

Access Class Barring (ACB)

- UE individual Access Class Barring
- Extended Access Barring

FOCUS ON THE EAB

A FLUID MODEL FOR THE ACCESS

$$\frac{dx_1}{dt} = \lambda - x_1 + \mu_1 x_{1,L},$$

$$\frac{dx_2}{dt} = p x_1 + \mu_2 x_{2,L} - x_2,$$

$$\frac{dx_{1,L}}{dt} = (1 - p) x_1 - \mu_1 x_{1,L},$$

$$\frac{dx_{2,L}}{dt} = (1 - q_N^{x_2-1}) x_2 - \mu_2 x_{2,L}.$$

$$q_N = \left(1 - \frac{1}{N}\right)$$

EFFICIENT SUPPORT OF IOT DEVICES

Estimating the access's
contention

CHALLENGES AT THE ACCESS

What is the optimal number of contending devices

- Best target for a control strategy

How to estimate the number of contending devices (in states X_1 and X_2) ?

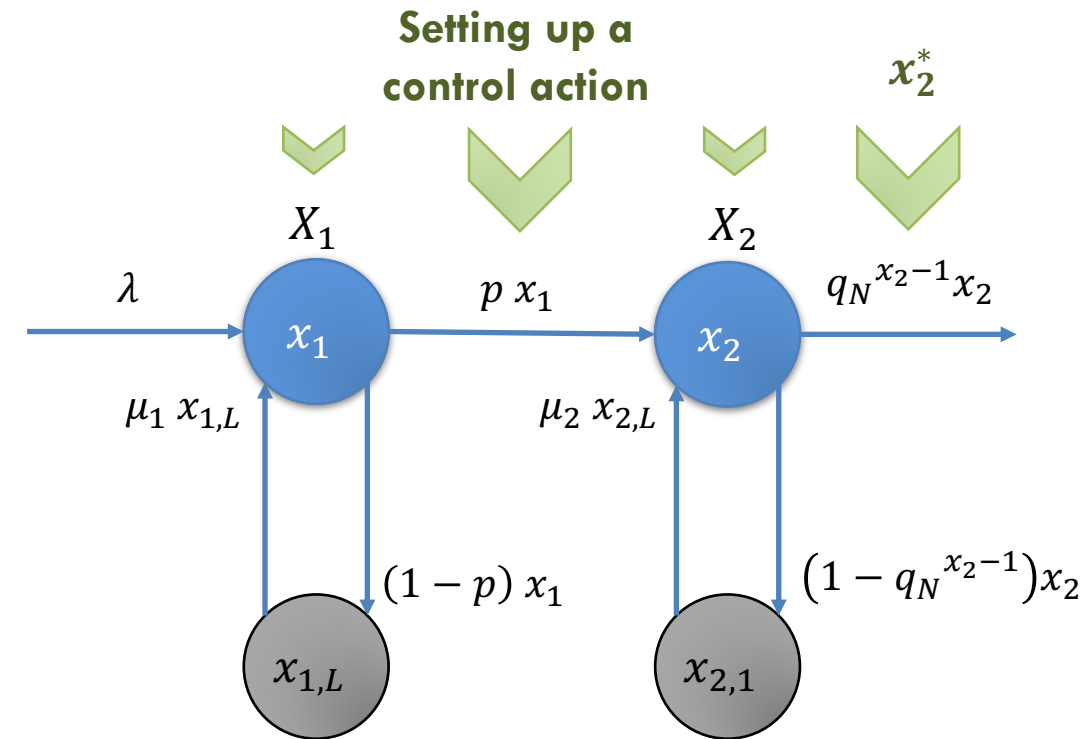

- **Difficulty:** no direct way to know it

What is the best control action to optimize the number of contending devices ?

- **Optimal barring strategy**
- **KPI:** delay, energy, abandons, number of attempts...
- **Difficulty:** Nonlinear model, non-affine in control

How **prioritize the contending devices** (sharing the same resources)?

- Per-class estimation, per-class barring

HOW TO DETERMINE THE OPTIMAL NUMBER OF CONTENDING DEVICES?

Method 1: Can be determined by Monte Carlo simulations

Maximized when:

of contending devices = 54

Number of opportunities N

WHAT IF WE KNOW THE NUMBER OF CONTENDING DEVICES AT THE TWO STEPS ?

The system can be solved optimally using a nonlinear version of the Linear Quadratic controller

Evolution of the number of M2M devices in x_2 vs the arrival rate

DIFFICULTY TO KNOW IN ADVANCE HOW MUCH TERMINALS WILL CONTEND FOR THE ACCESS

Planning doesn't really solve the problem

- We may know the time interval for the connection but not the exact time

The access of event-driven applications **cannot be quantified and cannot be planned**

WHAT ABOUT USING A MODEL AGNOSTIC APPROACH?

The Discrete Proportional Integral Controller (PID)

- Reduced complexity
 - Exploits the difference between the measured value and the targeted value
- Well know, common and robust controller

Does not really scale for a massive number of IoT devices

- Adaptive version ...
- Improving the estimation of the number of IoT devices

HOW TO DETERMINE THE OPTIMAL NUMBER OF CONTENDING DEVICES?

Method 2: Can be determined analytically

Analysis of N_S , $f(x) = x q^{x-1}$, $x \geq 0, N > 1$

$$q = 1 - \frac{1}{N}$$

We have $f(0) = f(\infty) = 0$ and

$$f'(x) = q^{x-1}(1 + \ln q)$$

giving a maximum at $x = x^* = -\frac{1}{\ln q}$

HOW TO DETERMINE THE NUMBER OF CONTENDING IOT DEVICES? (1)

Lower bound:

$$x_{2,\min} = N_S + 2 N_F$$

Knowing N_I , one can have an idea of the number of contending devices.

$$N_I = N q^{x_2} \text{ means that } x_2 = \frac{\ln \frac{N_I}{N}}{\ln q}$$

Work only when having at least 1 available slot
(Non too congested system)

HOW TO DETERMINE THE NUMBER OF CONTENDING IOT DEVICES? (2)

Knowing N_S , one can have an idea of the number of contending devices.

$$N_S = x_2 q^{x_2 - 1} \text{ means that } x_2 = \frac{W(q \ln q N_S)}{\ln q}$$

Work only when having at least 1 successful IoT access.

(Non too congested system)

But, two possible solutions ...

SOME RESULTS ...

SOME RESULTS ...

HOW TO DETERMINE THE NUMBER OF IOT DEVICES WILLING TO CONNECT?

Leveraging crowd sourcing for an optimized IoT access

- **Realistic** and requires a **minor modification of the actual standard**
- Enriching the connection request message with:
 - Counting the failing **ACB attempts**
 - Counting the number of **RA attempts**

The congestion level gives an idea of the **accuracy of the estimation** of the number of IoT devices willing to access

SOME RESULTS ...

CONCLUSIONS

Estimating the number of IoT devices willing to connect and the IoT devices contending for the access is a requirement

- Only way to guarantee the QoE
- Same technique could be used to estimate the number of different classes of IoT devices willing to connect

Need to develop such techniques for other networks than mobile networks (i.e. LoRa, Sigfox, ...)
